"Evaluation of the Changes in Non-esterified Fatty Acids in the Plasma in Clearing Reactions."

Prague, Casopis Lekaru Ceskych, Vol 105, No 24-25, 17 Jun 66, pp 681 - 682

Abstract: The increase in non-esterified fatty acids (NEF) in the clearing reaction *in vivo* was investigated; the possibility of the determination of the content of NEF by finding the concentration of albumin using bromosulfophthalein was studied. 23 healthy subjects were used in the experiments; it was found that the bromosulfophthalein method cannot be used to determine plasma concentration of NEF; the increase in their content can however, be determined in this way. 1 Figure, 5 Western, 6 Czech references.

✓ Blood catalase in a hybridization experiment with rabbits.  
Gy. Fábián and P. Székely (Acad. Sci., Tihany), *Acta  
Biol. Acad. Sci. Hung.*, 5, 119-30 (1954) (in English).—Blood  
catalase and hemoglobin studies were made on European  
gray rabbits (*Oryctolagus cuniculus*), domesticated Flemish  
guinea pigs, and the hybrids from crossing these strains. The  
catalase was highest in the wild rabbits and lowest in the  
hybrids. The manner of breeding had some influence on  
the catalase. The hemoglobin in young animals was 13%  
for the wild, 9% for the tame, and 12% for the hybrid.  
Within the same strain, some correlation existed between  
hemoglobin and catalase but not between strains.

Title : Further Investigation of the Effect of a Hormonal  
Inhibitory Factor.

Orig Pub : Acta physiol., Acad.sci. hung., 1957, 11, No 3-4, 377-  
383

Abstract : Inhibitory effect (IE) of a substance isolated from the  
brain of warm-blooded animals was studied. In experi-  
ments on isolated intestine of cat, it was determined  
that the degree of IE depends on changes of pH and con-  
centration of K. IE intensified on a background of prose-  
rine effect; furthermore, in its character, it was simi-  
lar to the effect of phosphorous ester of choline.  
Application of the substance to spinal radicles delayed

the conductivity of reflex discharges. The thresholds  
of electro-excitability increased considerably in direct  
application of the substance to cerebral cortex. Inter-  
peritoneal injections of the substance delayed the deve-  
lopment of convulsions after introduction to rats and  
mice of lethal doses of strychnine or eserine. The subs-  
tance obtained from the brain of an animal killed by in-  
troduction of strychnine possessed greater IE. This pecu-  
liarity was not observed in death of animals during con-  
vulsions induced by cardiazole. -- Z.Kh. Manovich

TITLE: Psychogenic polydipsia [This paper was presented at the Third Interdisciplinary Conference on Experimental and Clinical Study of Higher Nervous Functions held in Marianske Lazne from 19 to 23 October 1964.]

SOURCE: Activitas nervosa superior, v. 7, no. 2, 1965, 191-192

TOPIC TAGS: biologic metabolism, central nervous system, psychotherapy, psychoneurotic disorder

ABSTRACT: Psychogenic polydipsia is a functional disturbance of the central nervous regulation of water metabolism. Its clinical manifestation is an abnormal thirst. Excessive drinking leads to hypoosmosis resulting in polyuria. It is a psychiatric disease. 4 cases treated at the authors' hospital in 1958-64 are described. Polydipsia fluctuated between 4 and 16 l per day. In one case remission occurred spontaneously, in two psychotherapy was successful. In the fourth psychotherapy together with administration of Fenmetrazin-Spofa was effective. The prognosis of the disease is generally favorable. [JPRS]

Title: Occurrence of Mold Fungi Paecilomyces varioti, var. Bainier, in  
Sterilized, Glass-Packed Stewed Apricots

Original  
Publication: Prumysl potravin, 1956, 7, No 5, 216-218

Abstract: Detailed instructions are provided for determination and identification of the mold Paecilomyces varioti, var. Bainier, and methods for its control are described. Characteristic properties of the mold are considered.

TITLE: Reversible automatic and manual control switching circuit. CZ Pat. No. PV 3742-64, Class 21

TOPIC TAGS: automatic control design, switching circuit, magnetic amplifier

ABSTRACT: An electronic network for shifting from automatic control to manual and vice versa has been introduced. It incorporates a magnetic d-c output amplifier applied to the manual control system, a balancing circuit with a three-way switch, a preamplifier that feeds the output magnetic amplifier, and a controllable d-c power source with output diodes or a high resistance. The network operates under three possible settings: 1) the d-c output of the output magnetic amplifier is connected to the controlled system, for instance to the excitation winding of a synchronous alternator; 2) the output magnetic amplifier is parallel-coupled with the controllable d-c power source and both elements are linked to the controlled

TITLE: Czech patent no. 2183-64

SOURCE: Vynalezy, no. 9, 1965, 11-12

TOPIC TAGS: voltage regulator, potentiometer, resistor, fixed resistor, electro-mechanic converter

TRANSLATION: A circuit for group excitation of alternators in which each alternator-exciter has a master regulator, whose reference level is controlled by the reference voltage of a secondary regulator of the integrating type is discussed. Both regulators are connected to the voltage changer of the alternator and fed by an internal feed line, characterized by the fact that at the constant voltage source in each secondary regulator a potentiometer is connected in series with a fixed resistor which serves for the generation of the reference voltage. The reference voltage removed from the potentiometer arm and from the constant voltage supply of the secondary regulator is applied to the fixed resistor. All reference voltages of the individual secondary regulators are connected in parallel but each potentiometer arm is connected with the interconnecting wire by a switch.
